

Sitting at the heart of IMPULSE is the Core module. This is where the student record is securely stored and administered, helping to ensure that each child is appropriately provisioned for across every step of their educational journey.

IMPULSE core integrates with the IMPULSE portals:

PARENTS PORTAL

Parents and legal guardians can upload information about their children in relation to special needs, behavioural issues, school admissions and personal details such as name and address data.

PROFESSIONALS PORTAL

Professionals can respond to and upload information about their cases in relation to special needs, behavioural issues, manage their tasks, and refer cases.

SCHOOLS PORTAL

Schools can access a child's data in order to administer processes such as school admissions, ALN and SEND plans. Schools can also receive real-time information on the children at their school, and can use the data to help with fair access policies.

IMPULSE Core is the central hub around which a child's education is catered for. It is a definitive database which acts as a central source of truth. We understand, however, the importance of data segregation, sensitive data and regulations such as GDPR

As such, IMPULSE Core can be administered in such a way that staff have access to the data that is relevant to them. By segregating the data, we can help you to ensure that only the right people are accessing the data, and at the right time. You only see what you need to see.

This centralised record of documents keeps everything in your environment. It is a flexible solution, though. Where you use external database providers, we can integrate their data to ensure that you're maintaining and accessing the data in the ways which you need to.

Data stored in IMPULSE Core can be used to underpin the rest of the IMPULSE modules, to help best facilitate each child's education.
